

United Utilities

On behalf of United Utilities, over the last four years Mulberry has undertaken a detailed tree health assessment of approximately 60 kilometres of roadside woodland.

The project is completed each year within a four-week period and provides detailed information on the condition of United Utilities current tree stock identifying any immediate works required to remove any hazards.

The report is presented in a tabular format for each individual woodland which is supported with plans showing the location of each individual tree identified as a hazard.

United Utilities consistently return to Mulberry as the report is always delivered within their set timescales, in the format they require and is a cost effective way of ensuring the safe management of their roadside woodlands.
